Hydrant Flushing 101

To maintain water quality, lines and dead-end mains are flushed to remove stale water and ensure the presence of fresh water with sufficient disinfectant levels and improved taste and smell.

Over time, tiny particles can build up inside the water distribution pipes and impact water quality. Hydrants can achieve the necessary velocity to flush water mains and scour the lines.

When an emergency occurs, we want to be confident that our hydrants are tested and properly functioning so they are ready to be used.
